

A 3D molecular model of antibodies, showing their Y-shaped structure. The model is rendered in white and red, with a dark blue background. The antibodies are shown in various orientations, some appearing to be bound to a target. The background is a dark blue gradient with a subtle pattern of red and white, suggesting a complex molecular environment.

# Chicken Platforms

# Powered By Evolution

Greater evolutionary distance yields greater immunogenicity and more antibody diversity

# Orthologue Comparison

Chicken orthologues are always more divergent from human than those from mammalian species

# HER2 Orthologues

human vs mouse  
(differences in pink)

human vs chicken  
(differences in green)

# Engineering of Ig Loci

## ADAPTATION TO CHICKEN GENE CONVERSION PROCESS

### Gene conversion

for animation go to:  
<https://www.omniab.com/technology/omnichicken-omniclic>

### Human V's selected for:

- High expression level, stability, ubiquity
- High sequence diversity in CDRs
- Low sequence diversity in FWs

### Engineered locus

Gene conversion

### Diversified B cells

# OmniClic™: Tg Chickens with Common Light Chain

Engineered for Bispecific Antibody Discovery and Development

COMMON LIGHT CHAIN BASED UPON HUMAN VK3-15 SCAFFOLD

- Active V gene fully germline

- Pseudogenes also germline with no CDR sequence diversity

PAIRED WITH PROVEN VH3-23 HEAVY CHAIN

- Almost all mAb diversity occurs in VH, and in CDRs

# Sequence Diversity of PGRN mAbs from OmniChicken

VL

VH

Diversity is principally focused in the CDR regions of human VH and VL;  
a result of both transgene design and cellular selection

# Sequence Diversity of PGRN mAbs from OmniClic

VL

VH

Diversity is focused to CDRs of VH; very little mutation seen in VL

# Conclusions

- OmniChickens retain the antigen recognition capabilities of wild-type chickens, including response to conserved antigens, unique epitope coverage, and species cross-reactivity (*Ching et al, mAbs, 2017*)
- OmniChickens generate high affinity and high specificity antibodies through CDR focused diversification of transgenes that are designed upon a single-family human antibody scaffold (VH3/VK3) (*Leighton et al, Front. Immunol., 2018*)
- High affinity antibodies covering diverse epitopes can be obtained from OmniChickens with either kappa or lambda light chains. (*Ching et al, PLOS One, 2020*)
- OmniClic offers the ability to derive antibodies that focus sequence diversity almost entirely on the VH domain, leaving the VL essentially germline. (*Ching et al, mAbs 2021*)

naturally optimized human antibodies™

Common LC antibodies

For bispecific applications

The background of the slide features a complex, abstract molecular structure composed of numerous small spheres (atoms) connected by lines (bonds). The spheres are primarily dark blue and teal, with some lighter blue and white spheres interspersed. The structure is dense and multi-layered, creating a sense of depth and complexity. A thin orange horizontal line is positioned above the title text.

# Novel Scaffolds

# OmniDab: Transgenic chickens expressing heavy chain-only antibodies

## HCO STRATEGY USING TRUNCATED LIGHT CHAIN (TLC)

- Normal chicken heavy chain can express as VH alone
- VHH transgene in development

# OmniTaur: ultralong CDRH3s create novel binding domains

## UNIQUE STRUCTURAL FEATURES OF ULTRALONG H3 ANTIBODIES

- Novel structure may enable targeting epitopes unreachable by standard antibodies
- Long H3 domains can be expressed on human VH framework, or alone as ~5kD Picobodies™

Stanfield, et.al. *Sci Adv* (2020) 6(20): eaba0468.

The background of the slide features a complex, abstract molecular structure composed of numerous small spheres (atoms) connected by lines (bonds). The spheres are primarily dark blue and teal, with some lighter blue and white spheres interspersed. The structure is dense and occupies the upper half of the slide, with a horizontal orange line running across the middle. Below the line, the text "Screening Technologies" is displayed in a large, white, sans-serif font.

# Screening Technologies

# B cell screening

- **Bypass diversity and time bottleneck** of traditional hybridoma workflows
- Ligand offers two powerful single B-cell screening technologies: the **GEM assay** and **xPloration®**
- These two technologies enable **screening against difficult targets**: GPCRs, ion channels and surface antigens

B cell screening provides greater depth of data and more shots on goal for antibody discovery

# Screening for mAbs Using GEMs

1

Loading

2

Imaging &amp; Functional Assay

3

Recovery &amp; Single Cell NGS

- Unique through-hole format: no bottom
- ~1 cell/μPore
- Compatible with bacteria, yeast, and animal cells
- Established workflows for chicken, rat, mouse antibody secreting cells

- Flexible assays
- Dynamic time-scale
  - Repeated imaging

- Precise laser-based recovery
- 1 cell/sec (single cell mode)
  - Single cell barcoding
- 500 cells/sec (bulk mode)

## Laser Extraction

# xPloration deep dives

*Goal: Apply deep screening to find a more diverse panel of functional antibodies*

**GEM**

Seed sequences with  
functional binding data

**xPloration**

Large number of  
sequences to expand  
diversity

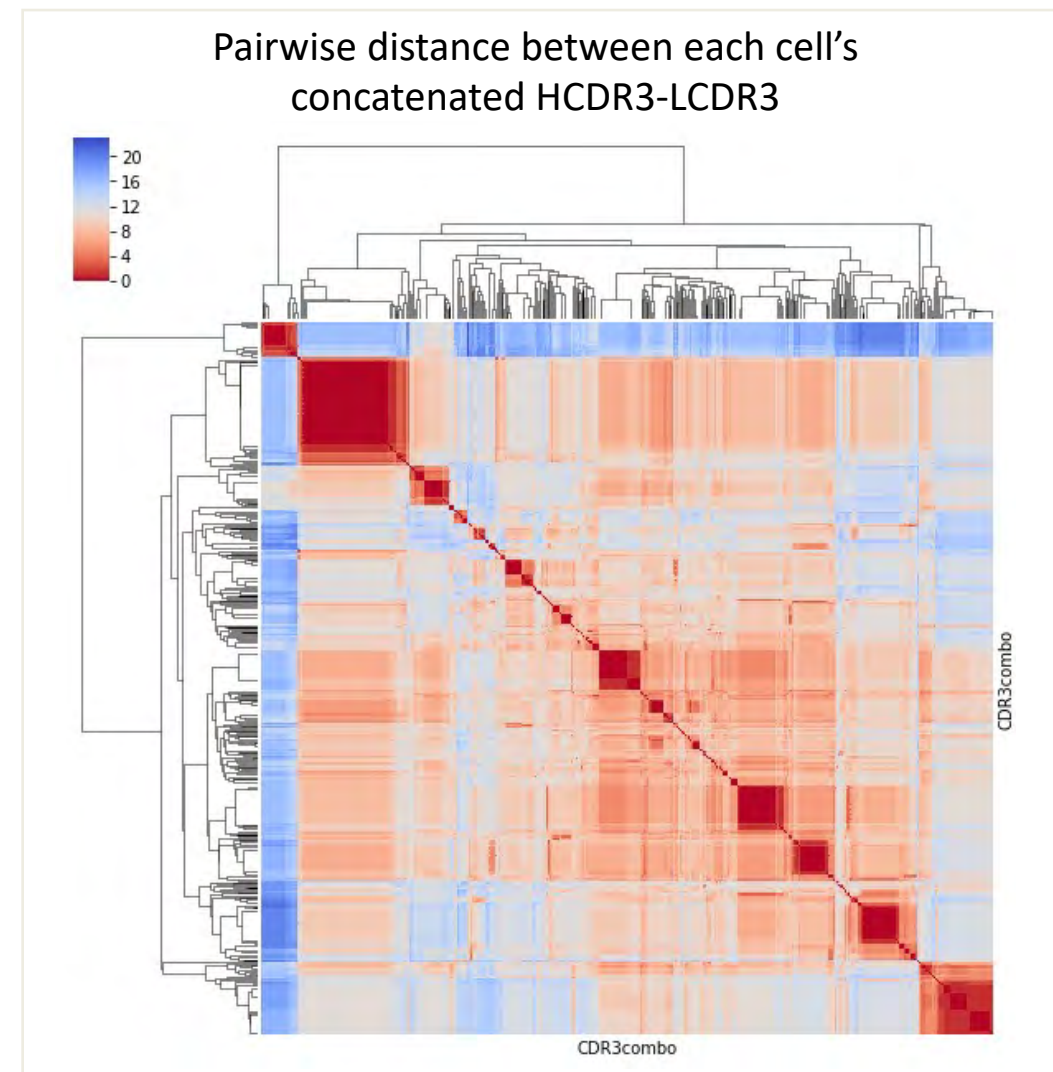

- New sequence clusters
  - Hit expansion
  - Optimization

# Natively-paired VH and VK recovery via cell barcoding

- Post screen, isolate cells in 96 well plate
- NGS sample prep and sequencing

Recovered Cells	No.	%
Captured	760	100%
Cells with paired H & K	569	75%
Unique sequences	485	64%
